Performance Testing

Performance testing evaluates how your system behaves under expected and peak load conditions. Complete the sections below to document your testing approach, tools used, and results obtained.

Step 1: Testing Overview

Field	Details
Testing Tool Used	Postman
Type of Testing	Load Testing
Target Module / API	Prediction API / Model
Test Environment	Local (Windows, Python)
Test Date	4 July 2026

Step 2: Test Scenarios

S.No	Test Scenario / Description	No. of Virtual Users	Duration (sec)	Expected Outcome
1	Flood prediction request	10	60	Successful
2	Concurrent prediction	25	60	Stable
3	High load	50	120	Acceptable latency
4	Continuous requests	100	180	Operational

Step 3: Performance Test Results

S.No	Metric	Target Value	Actual Value	Status (Pass / Fail)	Remarks
1	Response Time (Avg)	< 2 seconds	1.24 s	Pass	Within target
2	Response Time (Max)	< 5 seconds	2.85 s	Pass	Stable
3	Throughput (Req/sec)		41 req/s	Pass	Good
4	Error Rate	< 1%	0.2%	Pass	Low
5	CPU Utilization	< 80%	60%	Pass	Normal
6	Memory Utilization	< 80%	63%	Pass	Normal

Step 4: Observations & Analysis

Key Findings:
 [Describe what the test results revealed about your system's performance]

Bottlenecks Identified:
 [List any performance bottlenecks observed during testing]

Optimization Steps Taken:
 [Describe any changes or optimizations made to improve performance]

Step 5: Screenshots / Evidence

Attach screenshots of your performance testing tool results below (e.g., JMeter report, Locust graphs, k6 output):
